Notice of IBC Termination

Responsible Individual: Garcia, Emilio
Department: Biosciences, L-452

Application #: 2003-008,
Expiration Date: Apr 5, 2006

(b)(2)High

During a recent review of this project it was brought to our attention that this protocol needs to be terminated immediately. In the future all proposals for such experiments involving select agents must be submitted to the Select Agent Program via the RO, Brynte Johnson. CDC and USDA will review the proposed experiments in an interagency committee consisting of personnel from NIH OBA, CDC, USDA, and other subject matter experts as needed to determine if the experiments can be conducted and if so under what physical containment conditions. The Select Agent Program will issue a written response to the request in a timely manner.

All similar proposed experiments that do not involve select agents will be sent to OBA as a "Major Action" for their review prior to initiation of the experiments and review by the LLNL IBC. OBA will issue a written response to the request either disallowing the experiments or allowing them if certain physical containment conditions have been met. They may issue other instructions too.

Only after receiving the OBA written response can the LLNL IBC review the proposed experiments considering OBA's written response to either approve or disapprove the experiments.

Questions: If you have questions regarding IBC review or oversight of this research protocol, please contact the Institutional Biosafety Committee Office at Ext. 3-6287.

Sincerely,
